22 MAY 2003

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

Notes

- If you need help to fill in this form or you have any questions, please contact the Patent Office on 08459 500505.*
- Write your answers in capital letters using black ink or you may type them.*
- If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.*
- If you have answered 'Yes' Patents Form 7/77 will need to be filed.*
- Once you have filled in the form you must remember to sign and date it.*
- For details of the fee and ways to pay please contact the Patent Office.*

DUPLICATE

PHOSPHORESCENT DENDRIMERS

This invention relates to metal-containing phosphorescent dendrimers with at least one dendron that comprises one or more units that contain a nitrogen atom and light-emitting devices containing them.

A wide range of luminescent low molecular weight metal complexes are known and have been demonstrated as both light emitting and charge transporting materials in light emitting devices, in particular light-emitting diodes (LEDs) also known as electroluminescent (EL) devices. To make efficient devices there must be good charge injection, transport and emission from the excitonic state formed. For fluorescent molecules, a simple analysis of spin statistics associated with the injection of oppositely charged carriers which pair to form excitons shows that only 25% of the excitons formed in the LED are in the singlet state with the remainder forming triplets assuming 100% capture of the charged species. However it has been suggested that the barrier of 25% for singlet excitons may be exceeded for fluorescent polymers but it is still known to be far from 100%. For most organic materials only the singlet states can decay radiatively generating light, the triplet states decay non-radiatively. The possibility to extract luminescence from the triplet excited state has recently been demonstrated by inclusion of phosphorescent guest metallic complexes in host matrices. These phosphorescent metal complexes are generally used in a blend with an organic host. The organic host plays an important role as it is involved in charge transport but also acts as a triplet source, i.e. it transfers the excited state to the metal complex for emission. The main type of hosts used are based on carbazoles, e.g., CBP (4,4'-N,N'-dicarbazole-biphenyl) (H.Z/ Xie et al, Adv. Mater., 2001, 13, 1245) and TCTA (4,4',4''-tris-(carbazol-9-yl) triphenylamine) (M. Ikai et al, Appl. Phys. Lett., 2001, 79, 156). It should also be noted that TCTA contains a triarylamine moiety and it has been shown that this can be advantageous. However, at times blend systems are sensitive to the concentration of the guest in the host and only low concentrations of the guest can be used before phase separation leads to aggregation or intermolecular interactions of the emissive species

-2-

increases and this leads to emission quenching. It has been demonstrated that for optimum emission the proportion of phosphorescent emitter to host needs to be low to avoid triplet-triplet annihilation.

5 In addition the metal complexes used to date have been designed to be volatile so that layers can be deposited by thermal evaporation. For OLEDs using evaporated emitting layers the guest and host are co-evaporated, but this is a difficult process to control accurately, that is to get the correct ratio of guest to host. Co-evaporated layers may also lead to the greater probability of having two phosphorescent emitters closer together than in layers deposited from spin-coating a homogeneous solution of the two
10 components. In many applications solution processing would be preferable to evaporation, but the current molecular materials do not form good films when deposited by solution processing. In addition it would be advantageous to have guest host systems in which high levels of guest can be used. This is possible with dendritic materials.

We have already disclosed in British Application No. 0106307.2 that these
15 problems are solved by forming certain dendrimers with metal ions as part of the core. Dendrimers are branched macromolecules in which branched dendrons (also called dendrites) are attached to a core. The properties of the dendrimers make them ideal for solution processing and allow incorporation of metal complex chromophores, which have been demonstrated to be effective in light emitting devices (LEDs), into a solution
20 processable system.

Phosphorescent guest-host emissive layers that are produced by solution processing from a homogeneous solution should have the advantage that the phosphorescent guest is evenly distributed throughout the formed film, assuming of course that there is no phase separation. We have demonstrated that for dendrimers with
25 iridium as part of their core device performance is more tolerant of guest-host composition than evaporated devices containing iridium complexes. We believe that this is due to the more homogeneous films produced and the fact that the dendritic architecture keeps the cores separated and reduces triplet-triplet quenching.

Although the prior application shows how to produce solution processable

-3-

phosphorescent dendrimers, the most efficient LEDs from the dendrimers disclosed in British Application No. 0106307.2 still require that the dendritic phosphorescent guest is blended with a host material. We have now appreciated, according to the present invention, that it would be advantageous to have material in which the two components of the blend are in a single molecule for the following reasons:

1. It is critical that each time a blended film is prepared the correct ratio of guest to host material is used and this need is obviated if the components are within a single molecule.

2. The dendritic structure can be involved in the transportation of charge.

3. Incorporation of the components in a single molecule can give improved light emission.

4. The single molecule can allow simpler manufacturability.

5. The single molecule can give improved electrochemical stability.

6. Having the two components of the blend incorporated in a single molecule can give improved film stability, i.e. with no tendency for phase separation over time.

Accordingly the present invention provides a light emitting device and, in particular, a light emitting diode, which comprises at least one layer that contains a phosphorescent organometallic dendrimer with a metal cation as part of its core and with at least one dendron which comprises at least one nitrogen atom which forms part of an aromatic ring system or is directly bonded to at least two aromatic groups as well as the dendrimers used therein. Thus the dendrimers typically have the formula (I):

in which CORE represents a metal ion or a group containing a metal ion, n represents an integer of 1 or more, each DENDRON, which may be the same or different, represents a dendritic molecular structure comprising at least one nitrogen atom which forms part of an aromatic ring system or is directly attached to at least two aromatic groups, CORE

-4-

terminating in the single bond to the first nitrogen atom or aromatic ring to which more than one dendritic chain is attached, said nitrogen atom or ring forming part of said DENDRON. In a preferred embodiment the dendrons are inherently at least partially conjugated.

5 In an alternative embodiment the first branching point is an sp^3 hybridised carbon atom.

Dendrons are comprised of branching units and, optionally, linking units. Suitable branching units include aryl and heteroaryl, which can be fused, and N. It should be noted that a N-containing fused heteroaryl ring such as carbazole can be
10 considered a branching point. The links between branching points include bonding combinations such as aryl-aryl, aryl-vinyl-aryl, aryl-acetylenyl-aryl, aryl-aryl'-aryl (where aryl' may be different from aryl), N-aryl and N-aryl'-N where aryl and N are branching units. Preferred linking units include phenyl and fluorenyl. An individual dendron may contain one or more of each type of branching point. Moreover, in the case
15 of the aryl-vinyl-aryl and aryl-acetylenyl-aryl linkages within the dendron there may be one or more aryl- vinyl or aryl-acetylenyl link between the branching points. Indeed there may be more than one vinyl or acetylenyl or aryl moiety between two aryl branching units but preferably no more than three. Further, there can be advantages in using an asymmetric dendrimer i.e. where the dendrons are not all the same.

20 Inherently at least partially conjugated dendrons (dendrites) indicate that they are made up of alternating double and single bonds or N lone pairs, apart from the surface groups. However this does not mean that the π system is fully delocalised. The delocalisation of the π system is dependent on the regiochemistry of the attachments. In an inherently at least partially conjugated dendron any branching nitrogen will be
25 attached to 3 (hetero)aryl groups. It is preferred that at least one, and especially all, of the dendrons is/are inherently at least partially conjugated.

As used herein the terms aryl, vinyl, acetylenyl etc. refer to such groups that are divalent, trivalent or multivalent as appropriate. In a preferred embodiment, the dendrons are conjugated. In one embodiment the core (or CORE) is attached to a

-5-

nitrogen atom within the dendron which forms part of an aromatic ring system or is attached to two other (hetero) aryl groups. In a preferred embodiment the nitrogen atom forms part of a carbazole group or is attached to two aromatic groups, preferably phenyl groups or substituted fluorenyl groups such that the nitrogen atom forms part of a di- or tri- arylamine group.

Alternatively, the first single bond is attached to an aryl group, preferably a phenyl group. In a preferred embodiment the aryl group is attached to at least one carbazole group. In one embodiment the N-containing units within the dendron are carbazole units. In a preferred embodiment the branching points are carbazole units attached through the N, 3 and 6 positions. In another preferred embodiment the carbazole branching points are directly linked whilst in another they are separated by an aryl group, preferably phenyl. In another embodiment the dendrons have the nitrogen only included in a carbazole moiety, and all the dendrons attached to the core are of this type. It should also be noted that depending on which unit the nitrogen atom is in it can be part of an electron-transport or hole-transport or bipolar moiety.

It is preferred that when the last branching unit in a dendron is a triarylamine then the distal aryl groups possess one or more surface groups that are not hydrogen atoms. It is further preferred in this case that the dendrons are at least inherently partially conjugated.

In particular, DENDRON comprises in part an aromatic unit which contains a nitrogen atom. This nitrogen atom either forms part of an aromatic ring system or is directly attached to two or three aromatic groups. Where the nitrogen is part of a ring system, it is preferably in a carbazole group, and when it is attached to aromatic groups, the aromatic groups are preferably phenyl or substituted fluorenyl or heteroaryl groups. In a preferred embodiment the dendrimer comprises 3-21 carbazole units.

For molecular phosphorescent iridium based materials it has been reported that the host which often contains carbazole units can transfer its energy to the phosphorescent guest for emission. In the case of green and red emission the host has been reported to have higher energy levels than the guest and for blue emission the

-6-

energy levels of the host are reported to be lower than the guest. In the dendrimers that contain the host components in the dendron, the dendron singlet or triplet energy should preferably be such that it can, if formed, be transferred to the core for emission.

Therefore whilst the singlet or triplet energy of the dendrons is normally greater than the
5 emission energy of the core it can be below that of the core providing the energy difference is small enough to allow the transfer of energy to the core. To aid this it is preferred that the triplet excited states of the dendrons must be longer lived than the emissive state of the core.

The dendrimers of the invention are preferably luminescent in the solid state. The
10 luminescent moiety may be partially or wholly within the core itself. The luminescence is preferably from the metal cation containing core.

Suitable surface groups for the dendrimers, which are preferably present, and are attached to the distal (hetero)aryl group include branched and unbranched alkyl, especially *t*-butyl, branched and unbranched alkoxy, for example 2-ethylhexyloxy,
15 hydroxy, alkylsilane, carboxy, carbalkoxy, and vinyl. A more comprehensive list include a further-reactable alkene, (meth)acrylate, sulphur-containing, or silicon-containing group; sulphonyl group; polyether group; C₁-to-C₁₅ alkyl (preferably *t*-butyl) group; amine group; mono-, di- or tri-C₁-to-C₁₅ alkyl amine group; -COOR group wherein R is hydrogen or C₁-to-C₁₅ alkyl; -OR group wherein R is hydrogen, aryl, or
20 C₁-to-C₁₅ alkyl or alkenyl; -O₂SR group wherein R is C₁-to-C₁₅ alkyl or alkenyl; -SR group wherein R is aryl, or C₁-to-C₁₅ alkyl or alkenyl; -SiR₃ group wherein the R groups are the same or different and are hydrogen, C₁-to-C₁₅ alkyl or alkenyl, or -SR' group (R' is aryl or C₁-to-C₁₅ alkyl or alkenyl), aryl, or heteroaryl. Typically *t*-butyl and alkoxy groups are used. Different surface groups may be present on different dendrons or
25 different distal groups of a dendron. It is preferred that the dendrimer is solution processable i.e. the surface groups are such that the dendrimer can be dissolved in a solvent.

The surface group can be chosen such that the dendrimer can be patterned. For example a cross-linkable group is present which can be cross-linked upon irradiation or

-7-

by chemical reaction. Alternatively the surface group comprises a protecting group which can be removed to leave a group which can be cross-linked. In general, the surface groups are selected so the dendrimers are soluble in solvents suitable for solution processing.

5. The aryl groups within the dendrons can be typically benzene, naphthalene, biphenyl (in which case an aryl group is present in the link between adjacent branching points) anthracene, fluorene, pyridine, oxadiazole, triazole, triazine, thiophene, carbazole, quinoxaline and where appropriate substituted variations. Typical substituents include C, to C₁₅, alkyl or alkoxy groups. The aryl groups at the branching
- 10 points are preferably benzene rings, preferably coupled at ring positions 1, 3 and 5, triazinyl or carbazole rings. These groups may optionally be substituted. The carbazole units are typically connected at the 3-, 6- and N positions.

- It will be appreciated that one or more of the dendrons attached to the core can be unconjugated. Typically such dendrons include ether-type aryl dendrons, for example
- 15 where benzene rings are connected via a methyleneoxy link. It will also be appreciated that when there is more than one dendron, the dendrons can be of the same or different generation (generation level is determined by the number of sets of branching points). It may be advantageous for at least one dendron to be of the second, or higher, generation to provide the required solution processing properties.

- 20 The cores typically comprise a metal cation and attached ligands; the metal is central in the core and the core is luminescent. It should be noted that although the core is emissive the attachment of, and the regiochemistry of attachment of, the dendrons can directly affect the emissive properties of the core. The core normally comprises the metal cation and the aryl and heteroaryl units directly attached to the metal. In some
- 25 cases the heteroaryl and aryl can also form a branching point, e.g. if a second dendron is attached to the aryl or heteroaryl unit that is connected to the metal cation. However in such cases it is still the case that the dendrons attached to the (hetero)aryl unit that is bound to the metal cation must themselves contain at least one nitrogen atom which forms part of an aromatic ring system or is directly bonded to at least two aromatic

-8-

groups. It is to be understood that the term "metal ion" or "metal cation", as used herein, describes the charge state the metal would have without ligands attached (the oxidation state). In the dendrimers that contain a metal cation the overall charge of the dendrimer is neutral and the metal-ligand bonding will have more or less covalent

5 character depending on the metal and ligand involved.

When the core comprises a metal cation and attached ligands it is typically a complex of a metal cation and one, two or more coordinating groups, at least one, and preferably at least two, of the coordinating groups being bound to a dendron. Typically the luminescence of the dendrimer will derive from that complex. CORE is typically a

10 complex of a metal cation and two or more coordinating groups, at least one and preferably two or more of the said groups each being bound to a DENDRON moiety as defined in formula (I) by the single bond in which CORE in this formula terminates.

In one aspect of the invention CORE may be represented as a complex of the following formula (II):

15

wherein M is a metal cation, each [X-], which are the same or different, is a coordinating group X attached to a single bond in which CORE terminates, each Y, which may be the

20 same or different, is a coordinating group, q is an integer and r is 0 or an integer, the sum of (a.q) + (b.r) being equal to the number of coordination sites available on M, wherein a is the number of coordination sites on [X-] and b is the number of coordination sites on Y.

The single bond in the or each [X-] moiety, being a bond in which CORE

25 terminates, connects to a dendron. Preferably there are at least two dendrons in a dendrimer, in which case q in formula (II) is an integer of 2 or more. The said two or more dendrons typically have the structures represented by DENDRON as defined above. The coordinating groups Y, when present, are neutral or charged chelated ligands which are not attached to dendrons and which serve to fulfil the coordination

-9-

requirements of the metal cation. Suitable Y include arylpyridines and heteroaryl pyridines and substituted variants.

Suitable metals include metals in the second or third row of the transition metals especially iridium, rhenium and platinum.

- 5 The second or third row transition metals form organometallic complexes with carbon or nitrogen donors. These can include for example porphyrin and arylpyridines. For iridium metal cations the nitrogen donor is generally part of a heteroaromatic ring, such as pyridine or substituted pyridine, and the aryl is a phenyl, fused aryl, or more than one aromatic ring, or a heteroaryl, or a substituted equivalent. The dendron can be
- 10 attached to either of the rings. The two rings of the "ligand" are normally in conjugation, so that the metal forms a 5 membered cyclometallated ring. Alternatively the rings can be attached in such a way that they can form a 6-membered cyclometallated ring with the metal cation. For the metal dendrimer the emission colour is governed by the lowest energy ligand. For green emission a suitable ligand and
- 15 dendron attachment is shown in figure A. For red emission it is appropriate to have 3 coordinating ligands each with a dendron attached to pyridine, for example as in Figure B. Alternatively for red emission there could be one ligand as in Figure B and two dendritic ligands as in Figure A and the Figure B type ligand may or may not have a dendron attached. For the blue emission it is suitable to have 3 coordinating ligands
- 20 each with a dendron attached to the pyridine via say an ethylene link with, for example, fluoro groups on the phenyl, as shown in Figure C.

The dendrimers can be built in a convergent or divergent route, but a convergent route is preferred. Thus the dendrons are attached to the appropriate ligands and these are subsequently attached to the metal cation to form the dendritic metal complex.

- 25 Optionally where the synthetic route allows other non-dendritic ligands can subsequently be attached to said complex. Alternatively a ligand with a suitably reactive functional group can be complexed to the metal ion, and then reacted with appropriately functionalised dendrons. In this latter method, not all ligands have to have the reactive functional groups, and thus this method allows the attachment of dendrons to some but

-10-

not all of the ligands complexed to the metal. A key property of the dendrons is to impart solution processibility to the metal complex and therefore allow the formation of good quality thin films suitable for use in light-emitting diodes.

The dendritic metal complexes may be homoleptic or contain more than one type of dendritic ligand, as discussed above. Alternatively, the metal complex may contain one or preferably more than one, e.g. 2 or 3, dendritic ligands plus one or more non-dendritic ligands. Also for iridium it is possible to have two dendritic phenylpyridine ligands with the third ligand a non-dendritic arylpyridine ligand. It is desirable that the number and/or generation of dendritic ligands is sufficient to provide the required solution processing. In the case of the dendritic metal complexes where all the ligands are different the method of preparation may give rise to a statistical mixture of all complex types. This is not necessarily disadvantageous providing that the optical, electronic, and processing properties are satisfactory. In the case of mixed dendron complexes it is preferable that the moieties forming the attachment point to metal are all the same or have similar binding constants. In the case of dendritic complexes that contain two or more different dendrons at least one should desirably be a conjugated dendron. The conjugated dendrons can be comprised of a number of different types of branching units, as discussed above.

The surface groups and dendrites can be varied so the dendrimers are soluble in solvents, such as toluene, THF, water and alcoholic solvents such as methanol, suitable for the solution processing technique of choice. Typically t-butyl and alkoxy groups have been used. In addition, the choice of dendron and/or surface group can allow the formation of blends with dendrimers (organic or organometallic), polymer or molecular compounds. In an alternative embodiment of the present invention the other blend component can be a charge transport material.

According to another aspect of the present invention the organometallic dendrimer can be incorporated into a light emitting diode as either a homogeneous layer or as a blend with at least one dendrimer (organic or organometallic), polymer or molecular compound.

-11-

The organometallic dendrimers can be incorporated into an LED in a conventional manner. In its simplest form, an organic light emitting or electroluminescent device can be formed from a light emitting layer sandwiched between two electrodes, at least one of which must be transparent to the emitted light.

5 Such a device can have a conventional arrangement comprising a transparent substrate layer, a transparent electrode layer, a light emitting layer and a back electrode. For this purpose the standard materials can be used. Thus, typically, the transparent substrate layer is typically made of glass although other transparent materials such as PET, can be used.

10 The anode which is generally transparent is preferably made from indium tin oxide (ITO) although other similar materials including indium oxide/tin oxide, tin oxide/antimony, zinc oxide/aluminum, gold and platinum can also be used. Conducting polymers such as PANI (polyaniline) or PEDOT can also be used.

The cathode is normally made of a low work function metal or alloy such as Al, Ca, Mg, Li, or MgAl or optionally with an additional layer of LiF. As is well known, other layers may also be present, including a hole transporting material and/or an electron transporting material. For a phosphorescent dendrimer emitter, it has been found that it is particularly beneficial to have a hole-blocking/electron-transporting layer between the light emitting dendrimer layer and the cathode. In an alternative
20 configuration, the substrate may be an opaque material such as silicon and the light is emitted through the opposing electrode.

An advantage of the present invention is that the layer containing the dendrimer can be deposited from solution. Conventional solution processing techniques such as spin coating, ink-jet printing, printing, and dip-coating can be used to deposit the
25 dendrimer layer. In a typical device a solution containing the dendrimer is applied over the transparent electrode layer, the solvent evaporated, and then subsequent layers applied. The film thickness is typically 10nm to 1000nm, preferably less than 200nm, more preferably 30-120nm.

The invention will be described in the Examples which follow, with reference to

-12-

the accompanying drawings wherein:

Fig. 1 illustrates the preparation of carbazolyl dendritic arylpyridine ligands (Examples 1 to 3) and a first generation iridium dendrimer. (Example 11).

Fig. 2 illustrates the preparation of another carbazolyl arylpyridine dendritic
5 ligand (Examples 4 to 8).

Fig. 3 illustrates the preparation of a second generation carbazolyl dendritic ligand and a first generation iridium dendrimer (Examples 9, 10).

Fig. 4 illustrates the preparation of a second generation iridium dendrimer
(Example 12).

10 Fig. 5 illustrates the preparation of another first generation iridium dendrimer (Example 13-15).

Example 1

DEHP-Car (1)

15 3,6-Di[4'-(2"-ethylhexyloxy)phenyl]carbazole

A mixture of 3,6-dibromocarbazole (12.0 g, 37.1 mmol), the boronic compound **G0-BX₂**, see below; (24.1 g, 96.4 mmol), tetrakis(triphenylphosphine) palladium (0) (800 mg, 0.692 mmol), 2 M Na₂CO_{3(aq)} (40 cm³), EtOH (40 cm³) and toluene (100 cm³) was degassed and then heated at reflux (with bath temperature of 100 °C) under argon for 42

20 h. The mixture was allowed to cool and diluted with H₂O (30 cm³) and ether (40 cm³).

The two layers were separated. The aqueous layer was extracted with ether (3 x 40 cm³).

The organic layer and the ether extracts were combined, washed with brine (1 x 50 cm³)

and dried (Na₂SO₄) and filtered. The solvents were completely removed and the residue was purified by column chromatography over silica using ethyl acetate-light petroleum

25 (0:1 to 1:10) and DCM-ethyl acetate-light petroleum (4:1:20) as eluent to give 14.7 g (69%) of **1**; *m/z* [APCI⁺] 576 (M⁺).

G0-BX₂ was prepared as follows:

G0-Br

4-(2'-Ethylhexyloxy)phenylbromide

-13-

Sodium hydride (60% dispersion in oil, 17.4 g, 435 mmol) was added in portions to a cold (ice-bath) solution of 4-bromophenol (49.0 g, 283 mmol) in dry DMF (780 cm³). The mixture was stirred at that temperature for 2 h and the ice bath was removed. A solution of 2-ethylhexylbromide (54.4 cm³, 306 mmol) in 150 cm³ of dry DMF was added dropwise through an addition funnel to the reaction mixture and the reaction was stirred at room temperature overnight (21 h). The resultant mixture was diluted with water (400 cm³) and ether (500 cm³). The two phases were separated. The aqueous layer was extracted with ether (3 x 300 cm³) and the organic portion and the ether extracts were dried over anhydrous MgSO₄, filtered and the filtrate was collected and evaporated under reduced pressure to leave a yellow oil. Column chromatography over silica (half amount each time) with light petroleum as eluent afforded **G0-Br** (54.1 g, 67%) $\lambda_{\text{max}}(\text{CH}_2\text{Cl}_2)/\text{nm}$ 284 ($\epsilon/\text{dm}^3\text{mol}^{-1}\text{cm}^{-1}$ 1251), and 291sh (1001); $\delta_{\text{H}}(400 \text{ MHz}; \text{CDCl}_3)$ 0.83-0.97 (6 H, m, Me), 1.30-1.57 (8 H, m, CH₂), 1.68-1.79 (1 H, m, CH), 3.78-3.84 (2 H, m, ArOCH₂), 6.74-6.80 (2 H, m, ArH), and 7.33-7.40 (2 H, m, ArH); $\delta_{\text{C}}(100 \text{ MHz}; \text{CDCl}_3)$ 11.1, 14.1, 23.0, 23.8, 29.1, 30.4, 39.3, 70.7, 112.4, 116.3, 132.1, and 158.5.

G0-B(X)₂**4-(2'-Ethylhexyloxy)phenylboronic acid**

Tert-butyl lithium (1.7 M, 66.0 cm³, 112 mmol) was added carefully to a cold (dry-ice/acetone bath) solution of **G0-Br** (20.0 g, 70.1 mmol) in 300 cm³ of anhydrous THF under an argon atmosphere. The mixture was stirred at -78 °C for 1 h and then tri-methyl borate (57.2 cm³, 421 mmol) was added slowly to the cold mixture. The reaction was stirred at -78 °C for 2 h before being removed from the dry-ice/acetone bath. The mixture was then stirred at room temperature for further 2.5 h before being quenched with 3 M HCl_(aq) (30 cm³). The two layers were separated. The aqueous layer was extracted with DCM (3 x 30 cm³). The organic layer and the DCM extracts were combined and dried over anhydrous magnesium sulfate, filtered and the solvents were completely removed. Purification by column chromatography over silica using ethyl acetate-light petroleum (1:10), and then ethyl acetate-DCM (0:1 to 1:3) as eluent gave

-14-

two major bands; less polar compound **G0-B(X)₂A**, 6.44 g; δ_H (200 MHz; CDCl₃) 0.81-1.05 (6 H, m, Me), 1.22-1.62 (8 H, m, CH₂), 1.68-1.88 (1 H, m, CH), 3.91 (2 H, m, ArOCH₂), 6.98 (2 H, m, ArH), and 7.77 (2 H, m, ArH); and more polar compound, a trimer, **G0-B(X)₂B**, 8.40 g; δ_H (200 MHz; CDCl₃) 0.85-1.07 (6 H, m, Me), 1.30-1.64 (8 H, m, CH₂), 1.70-1.90 (1 H, m, CH), 3.95 (2 H, m, ArOCH₂), 7.03 (2 H, m, ArH), and 8.18 (2 H, m, ArH).

Note: either compound G0-B(X)₂A or G0-B(X)₂B can be used in the reaction to form the next generation dendrons.

Example 2

10 2-(3'-Car G1-Ph)Py (2)

2-(3'-{3'',6''-Di[4'''-(2'''-ethylhexyloxy)phenyl]carbazolyl}phenyl)pyridine

Tris(dibenzylideneacetone)di-palladium (0) [Pd₂(dba)₃] (175 mg, 0.191 mmol) and tri-*tert*-butylphosphine (10% in hexane, 1.6 cm³) were added to a degassed (Schlenk line, evacuated and back-filled with argon) mixture of carbazolyl compound **1** (3.50 g, 6.08 mmol), 2-(3'-bromophenyl)pyridine, **2-(3'-BrPh)Py**, M. van der Sluis, V. Beverwijk, A. Termaten, F. Bickelhaupt, H. Kooijman, A. L. Spek, *Organometallics*, 1999, 18, 1402-1407; (2.85 g, 12.2 mmol), sodium *tert*-butoxide (1.75 g, 18.2 mmol), and freshly distilled toluene (from sodium under nitrogen) (6.0 cm³). The dark purple mixture was degassed again before being heated at reflux (with bath temperature of 130-135 °C) under argon for 68 h. The mixture was allowed to cool and washed with H₂O (1 x 15 cm³), dried (MgSO₄) and filtered and the solvent was removed. The mixture was purified by column chromatography over silica using DCM-light petroleum (1:4) as eluent to give 4.27 g (96%) of **2** as a light brown yellow oil; *m/z* [APCI⁺] 729 (M⁺).

25 Example 3

2-(3'-Car G2-PhPh)Py

2-[3'-(3''-5''-Di{3'''-6'''-di[4'''-(2'''-

ethylhexyloxy)phenyl]carbazolyl}phenyl)phenyl]pyridine

-15-

Tris(dibenzylideneacetone)di-palladium (0) [$\text{Pd}_2(\text{dba})_3$] (60 mg, 0.066 mmol) and tri-*tert*-butylphosphine (10% in hexane, 1.0 cm^3) were added to a degassed (Schlenk line, evacuated and back-filled with argon) mixture of carbazolyl compound **1** (3.55 g, 6.17 mmol), 2-[3'-(3'',5''-dibromophenyl)phenyl]pyridine, **DBPPh-Py** see below; (1.00 g, 2.57 mmol), sodium *tert*-butoxide (988 mg, 10.3 mmol), and freshly distilled toluene (from sodium under nitrogen) (15 cm^3). The dark purple to brown mixture was degassed again before being heated (with bath temperature of 80 °C for 17 h) and then at reflux (with bath temperature of 130-135 °C) under argon for 5 days. The reaction was allowed to cool to room temperature and quenched with 5 cm^3 of H_2O . The mixture was purified by column chromatography over silica using DCM-light petroleum (0:1 to 1:40) as eluent to give 3.22 g (91%) of **3**; (Found: C, 84.4; H, 7.8, N, 3.1. $\text{C}_{97}\text{H}_{107}\text{N}_3\text{O}_4$ requires C, 84.5; H, 7.8, N, 3.1%); δ_{H} (400 MHz; CDCl_3) 0.92-1.07 (24 H, m, Me), 1.32-1.68 (32 H, m, CH_2), 1.73-1.89 (4 H, m, CH), 3.96 (8 H, m, ArOCH_2), 7.08 (8 H, m, ArH), 7.26-7.33 (1 H, m, PyH), 7.61-8.14 (24 H, m, ArH, CarH & PyH), 8.40 (1 H, m, CarH), 8.46 (1 H, m, ArH), and 8.74 (1 H, m, PyH); δ_{C} (101 MHz; CDCl_3) 11.2, 14.2, 23.1, 23.9, 29.1, 30.6, 39.4, 70.6, 110.1, 114.9, 118.5, 120.7, 122.5, 123.5, 124.2, 124.4, 125.6, 126.0, 127.0, 127.7, 128.2, 129.7, 133.8, 134.1, 136.9, 139.8, 139.9, 140.1, 140.4, 144.7, 149.8, 156.8, and 158.6; m/z [MALDI] 1378, 1379, 1380, 1381, 1382 (M^+).

DBPPh-Py was prepared as follows:

20 **PPh-BOR₂**

2-[3'-(4'',4'',5'',5''-tetramethyl-1'',3'',2''-dioxaborolan-2''-yl)phenyl]pyridine

Tert-butyl lithium (1.7 M, 36.6 cm^3 , 62.1 mmol) was added to a cold (dry-ice/acetone bath) solution of 2-(3'-BrPh)Py (8.10 g, 34.6 mmol) in 130 cm^3 of anhydrous THF under an argon atmosphere. The mixture was stirred at -78 °C for 2 h and then 2-isopropoxy-4,4,5,5-tetramethyl-1,3,2-dioxaborolane (9 cm^3) was added rapidly to the cold mixture. The reaction was stirred at -78 °C for 2 h and the dry-ice/acetone bath was removed. The mixture was then stirred at room temperature for further 20 h before being quenched with H_2O (30 cm^3). The two layers were separated. The aqueous layer was

-16-

extracted with ether (3 x 40 cm³). To the aqueous layer, NaCHO₃(sat) (40 cm³) was added and the aqueous layer was further extracted with ether (2 X 40 cm³). The organic layer and the ether extracts were combined and dried over anhydrous sodium sulfate, filtered and the solvents removed. Purification of the crude mixture by column chromatography over silica using DCM-light petroleum (0:1 to 1:30) as eluent gave 4.92 g (50%) of PPh-BOR₂; (Found: C, 72.6; H, 7.2; N, 5.0. C₁₇H₂₀BNO₂ requires C, 72.6; H, 7.2; N, 5.0%); δ_{H} (400 MHz; CDCl₃) 1.37 (12 H, s, Me), 7.23 (1 H, m, PyH), 7.51 (1 H, m, ArH), 7.76 (1 H, m, PyH), 7.80 (1 H, m, ArH), 7.87 (1 H, m, PyH), 8.14 (1 H, m, ArH), 8.40 (1 H, m, ArH), and 8.71 (1 H, m, PyH); δ_{C} (101 MHz; CDCl₃) 24.9, 83.9, 120.7, 122.0, 128.2, 129.9, 133.2, 135.3, 136.6, 138.7, 149.6, 154.6, and 157.5; m/z [APCI⁺] 283 (MH⁺).

DBPPh-Py

2-[3'-(3'',5''-Di-bromophenyl)phenyl]pyridine

A mixture of PPh-BOR₂ (5.15 g, 281 mmol), 1,3,5-tribromobenzene (6.92 g, 315 mmol), tetrakis(triphenylphosphine) palladium (0) (846 mg, 0.732 mmol), 2 M Na₂CO₃(aq) (12 cm³), EtOH (12 cm³) and toluene (48 cm³) was degassed and then heated at reflux (with bath temperature of 105-110 °C) under argon for 19.5 h. The mixture was allowed to cool. Water (10 cm³) and ether (20 cm³) were added to the mixture. The two phases were separated. The aqueous layer was extracted with ether (3 x 20 cm³). The organic layer and the ether extracts were combined and dried over anhydrous sodium sulfate and filtered. The solvents were completely removed. The residue was purified by column chromatography over silica using ethyl acetate-light petroleum (0:1 to 1:20) as eluent to give 4.70 g (66%) of DBPPh-Py; (Found: C, 52.6; H, 2.5, N, 3.6. C₁₇H₁₁Br₂N requires C, 52.5; H, 2.9, N, 3.6%); δ_{H} (400 MHz; CDCl₃) 7.29 (1 H, m, PyH), 7.57 (2 H, m, ArH), 7.67 (1 H, m, ArH), 7.75 (2 H, m, ArH), 7.79 (2 H, m, PyH), 7.99 (1 H, m, ArH), 8.19 (1 H, m, ArH), and 8.74 (1 H, m, PyH); δ_{C} (101 MHz; CDCl₃) 120.7, 122.5, 123.2, 125.7, 126.9, 127.6, 129.1, 129.4, 132.7, 136.9, 138.9, 140.2, 144.6, 149.8, and 156.8; m/z [EI] 386, 388, 390 (MH⁺).

-17-

Example 4CarPh-Br (8)4-{3',6'-Di[4''-(2'''-ethylhexyloxy)phenyl]carbazolyl}phenyl bromide*Method 1:*

- 5 Tris(dibenzylideneacetone)di-palladium (0) [Pd₂(dba)₃] (125 mg, 0.137 mmol) and tri-*tert*-butylphosphine (10% in hexane, 0.5 cm³) were added to a degassed (Schlenk line, evacuated and back-filled with argon) mixture of carbazolyl compound **1** [Example 1] (3.14 g, 5.45 mmol), 1,4-dibromobenzene (12.3 g, 52.2 mmol), sodium *tert*-butoxide (1.00 g, 10.4 mmol), and distilled xylenes (15 cm³). The mixture was degassed again
- 10 before being heated (with bath temperature of 135 °C) under argon for 115 h. The mixture was allowed to cool to ambient temperature and quenched with H₂O (0.5 cm³). The mixture was purified by column chromatography over silica using light petroleum as eluent to give 1.46 g (37%) of **8**; (Found: C, 76.1; H, 7.1, N, 2.1. C₄₆H₅₂BrNO₂ requires C, 75.6; H, 7.2, N, 1.9%); δ_H(400 MHz; CD₂Cl₂) 0.94-1.03 (12 H, m, Me), 1.46-
- 15 1.70 (16 H, m, CH₂), 1.77-1.89 (2 H, m, CH), 3.97 (4 H, m, ArOCH₂), 7.07 (4 H, m, ArH), 7.47 (2 H, m, ArH), 7.52 (2 H, m, CarH), 7.64-7.73 (6 H, m, ArH), 7.79 (2 H, m, CarH), and 8.41 (2 H, m, CarH); δ_C(101 MHz; CD₂Cl₂) 11.8, 14.7, 23.9, 24.7, 29.9, 31.4, 40.3, 71.4, 110.7, 115.7, 119.0, 121.4, 124.9, 126.1, 128.8, 129.2, 133.9, 134.3, 134.6, 137.6, 140.9, and 159.5; *m/z* [MALDI⁺] 730, 731, 732, 733, 734 (MH⁺).

20

Method 2:

- Tris(dibenzylideneacetone)di-palladium (0) [Pd₂(dba)₃] (25 mg, 0.027 mmol) and tri-*tert*-butylphosphine (10% in hexane, 0.1 cm³) were added to a degassed (Schlenk line, evacuated and back-filled with argon) mixture of carbazolyl compound **1** [Example 1]
- 25 (628 mg, 1.09 mmol), 1-bromo-4-iodobenzene (1.54 g, 5.45 mmol), sodium *tert*-butoxide (200 mg, 2.08 mmol), and distilled xylenes (3 cm³). The mixture was degassed again before being heated (with bath temperature of 131 °C) under argon for 27 h. The resultant was allowed to cool to room temperature and quenched with H₂O (0.5 cm³). The mixture was purified by column chromatography over silica using DCM-light

-18-

petroleum (0:1 to 1:20) as eluent to give 476 mg (60%) of **8** as an oil; characterization data as above.

Example 5

5 **CarPh-BOR₂** (**9**)

2-(4-{3'.6'-Di[4''-(2'''-ethylhexyloxy)phenyl]carbazolyl}phenyl)-(4.4.5.5-tetramethyl-1.3.2-dioxaborolane)

Tert-butyl lithium (1.7 M, 3.0 cm³, 5.17 mmol) was added to a cold (dry-ice/acetone bath) solution of aryl bromide **8** (2.36 g, 3.23 mmol) in 22 cm³ of anhydrous THF under an argon atmosphere. The mixture was stirred at -78 °C for 1 h and then 2-isopropoxy-4,4,5,5-tetramethyl-1,3,2-dioxaborolane (1.32 cm³, 6.46 mmol) was added rapidly to the cold mixture. The reaction was stirred at -78 °C for 2 h before being removed from the dry-ice/acetone bath. The mixture was then stirred at room temperature overnight (12.5 h) before being quenched with H₂O (3 cm³). One hour later, 10 cm³ of ether and 20 cm³ of brine were added to the mixture. The two layers were separated. The aqueous layer was extracted with ether (3 x 20 cm³). The organic layer and the ether extracts were combined, washed with brine (1 x 40 cm³) and dried over anhydrous sodium sulfate, filtered and the solvents were completely removed. Purification by column chromatography over silica using DCM-light petroleum (0:1 to 1:4) as eluent gave 1.24 g (49%) of **9**; (Found: C, 80.3; H, 8.3; N, 1.8. C₃₂H₆₄BNO₄ requires C, 80.3; H, 8.3; N, 1.8%) δ_{H} (400 MHz; CDCl₃) 0.96-1.03 (12 H, m, Me), 1.33-1.66 (28 H, m, CH₂ & Me), 1.76-1.87 (2 H, m, CH), 3.95 (4 H, m, ArOCH₂), 7.07 (4 H, m, ArH), 7.53 (2 H, m, CarH), 7.62-7.71 (8 H, m, ArH & CarH), 8.12 (2 H, m, ArH), and 8.38 (2 H, m, CarH), δ_{C} (101 MHz; CDCl₃) 11.2, 14.2, 23.1, 23.9, 24.9, 29.1, 30.6, 39.4, 84.1, 110.2, 114.9, 118.3, 124.2, 125.4, 125.8, 128.2, 133.5, 134.2, 136.4, 140.1, 140.4, and 158.5; *m/z* [MALDI] 777, 778, 779, 780, 781 (M⁺).

-19-

Example 6**CarPh-Car**3,6-di(4'-{3'',6''-di[4'''-(2''''-ethylhexyloxy)phenyl]carbazolyl}phenyl)carbazole

- A mixture of 3,6-dibromocarbazole (196 mg, 0.604 mmol), **9** (1.08 g, 1.39 mmol),
 5 tetrakis(triphenylphosphine) palladium (0) (35 mg, 0.030 mmol), 2 M Na₂CO_{3(aq)} (0.8 cm³), EtOH (0.8 cm³) and toluene (2.0 cm³) was degassed and then heated at reflux (with bath temperature of 112 °C) under argon for 37 h. The resultant orange mixture was allowed to cool to room temperature and purified by column chromatography over silica using DCM-light petroleum (0:1 to 1:10) as eluent to give 571 mg (65%) of **10**; δ_H (400 MHz; CDCl₃) 0.92-1.06 (24 H, m, Me), 1.34-1.67 (32 H, m, CH₂), 1.76-1.88 (4 H, m, CH), 3.94 (8 H, m, ArOCH₂), 7.06 (8 H, m, ArH), 7.52-7.61 (6 H, m, CarH & ArH), 7.64-7.76 (16 H, m, ArH & CarH), 7.82 (2 H, m, CarH), 7.98 (4 H, m, CarH), 8.15 (1 H, br s, NH), 8.39 (4 H, m, CarH), and 8.52 (1 H, m, CarH); δ_C (101 MHz; CDCl₃) 11.2, 14.2, 23.1, 23.9, 29.1, 30.6, 39.5, 70.6, 110.2, 111.3, 114.9, 118.3, 118.9, 124.1, 125.3,
 10 125.6, 127.1, 128.2, 128.6, 132.2, 133.4, 134.3, 136.2, 139.6, 140.4, 141.0, and 158.6;
 15 m/z [MALDI] 1467, 1468, 1469, 1470, 1471 (MH⁺).

Example 72-(3'-CarPh G3-PhPh)Py (11)

- 20 2-(3'-{3''-5''-di[3'''-6'''-di(4''''-{3''''-6''''-di[4'''''-(2''''''-ethylhexyloxy)phenyl]carbazolyl}phenyl)carbazolyl}phenyl}phenyl)pyridine
 Tris(dibenzylideneacetone)di-palladium (0) [Pd₂(dba)₃] (2.2 mg, 0.002 mmol) and tri-*tert*-butylphosphine (10% in hexane, 0.05 cm³) were added to a degassed (Schlenk line, evacuated and back-filled with argon) mixture of carbazolyl compound **10** (339 mg, 0.231 mmol), 2-[3'-(3,5-dibromophenyl)phenyl]pyridine **DBPPh-Py** (37.5 mg, 0.096 mmol), sodium *tert*-butoxide (37 mg, 0.385 mmol), and distilled xylenes (0.9 cm³). The mixture was degassed again before being heated (with bath temperature of 121 °C) under argon for 3 days. The mixture was allowed to cool to room temperature and quenched with H₂O (0.2 cm³). The mixture was purified by column chromatography over silica

-20-

using DCM-light petroleum (0:1 to 1:20) as eluent to give 45 mg (15%) of **11**; δ_{H} (200 MHz; CDCl_3) 0.88-1.06 (48 H, m, Me), 1.25-1.64 (64 H, m, CH_2), 1.66-1.90 (8 H, m, CH), 3.89 (16 H, m, ArOCH_2), 7.03 (16 H, m, ArH), 7.20-7.36 (1 H, m, PyH), 7.48-8.13 (60 H, m, CarH, ArH & PyH), 8.14-8.64 (17 H, m, ArH & CarH), and 8.75 (1 H, m, PyH); m/z [MALDI] 3160, 3161, 3162, 3163, 3164, 3165 (MH^+).

Example 8

CPh-Py (12)

2-[3'-(N-Carbazolyl)phenyl]pyridine

- 10 Tris(dibenzylideneacetone)di-palladium (0) [$\text{Pd}_2(\text{dba})_3$] (60 mg, 0.066 mmol) and tri-*tert*-butylphosphine (10% in hexane, 0.3 cm^3) were added to a degassed (Schlenk line, evacuated and back-filled with argon) mixture of carbazole (1.31 g, 7.82 mmol), 2-(3'-bromophenyl)pyridine (2-(3'-BrPh)Py) (610 mg, 2.61 mmol), sodium *tert*-butoxide (1.00 g, 10.4 mmol), and distilled toluene (15 cm^3). The mixture was degassed again
- 15 before being heated (with bath temperature of 135 °C) under argon for 118 h. The mixture was allowed to cool to ambient temperature and quenched with H_2O (0.5 cm^3). The mixture was purified by column chromatography over silica using DCM-light petroleum (0:1 to 1:30) and then ethyl acetate-light petroleum (1:20) as eluent to give
- 835 mg (100%) of **12**; δ_{H} (200 MHz; CDCl_3) 7.21-7.92 (11 H, m, PyH, CarH & ArH),
- 20 8.12-8.33 (4 H, m, PyH, CarH & ArH), and 8.75 (1 H, m, PyH); m/z [APCI $^+$] 321, 322, 323 (MH^+).

Example 9

DBCPh-Py(13)

- 25 2-[3'-(3"-6"-Di-bromocarbazolyl)phenyl]pyridine

A solution of NBS (547 mg, 3.08 mmol) in 27 cm^3 of dried (over molecular sieves) DMF was added dropwise (over ~20 min) to a cold (ice-bath) solution of carbazolylphenylpyridine **12** (465 mg, 1.45 mmol) in 41 cm^3 of anhydrous DMF under argon. The mixture was stirred at 0-2 °C for 3.5 h and then ambient temperature for 42 h.

-21-

The crude (brown mixture) was poured into 50 cm³ of water and extracted with ether (3 x 100 cm³). The ether extracts were combined, washed with brine (1 x 100 cm³) and dried (Na₂SO₄), filtered and the solvents were removed to leave a brown solid. The crude residue was washed with light petroleum (3 x 100 cm³). The solid was collected and dried under reduced pressure to give 540 mg (70%) of **13**; δ_{H} (200 MHz; CDCl₃) 7.23-7.40 (3 H, m, PyH & CarH), 7.42-7.60 (3 H, m, ArH & CarH), 7.62-7.78 (3 H, m, PyH & ArH), 8.09-8.28 (4 H, m, PyH, CarH & ArH), and 8.72 (1 H, m, PyH); m/z [APCI⁺] 477, 479, 481 (MH⁺).

10 Example 10

2-(3'-Car G2-Ph)Py (14)

2-[3'-(3''-di{3'''-6'''-Di[4'''-(2'''-

ethylhexyloxy)phenyl]carbazolyl}carbazolyl)phenyl]pyridine

Tris(dibenzylideneacetone)di-palladium (0) [Pd₂(dba)₃] (12 mg, 0.013 mmol) and tri-
 15 *tert*-butylphosphine (10% in hexane, 0.2 cm³) were added to a degassed (Schlenk line, evacuated and back-filled with argon) mixture of 2-[3'-(3''-6''-di-bromocarbazolyl)phenyl]pyridine **13** (280 mg, 0.586 mmol), DEHP-Car **1** (Example 1) (800 mg, 1.39 mmol), sodium *tert*-butoxide (200 mg, 2.08 mmol), and distilled xylenes (3 cm³). The mixture was degassed again before being heated (with bath temperature of
 20 133 °C) under argon for one week. The mixture was allowed to cool to room temperature and quenched with H₂O (0.5 cm³). The crude was purified by column chromatography over silica using DCM-light petroleum (0:1 to 1:10) as eluent to give
 25 \approx 173 mg (\approx 20%) of **14**; δ_{H} (200 MHz; CDCl₃) 0.82-1.05 (24 H, m, Me), 1.24-1.64 (32 H, m, CH₂), 1.66-1.89 (4 H, m, CH), 3.92 (8 H, m, ArOCH₂), 7.03 (8 H, m, ArH), 7.28-7.93 (26 H, m, PyH, CarH & ArH), 8.18-8.47 (7 H, m, ArH, PyH & CarH), and 8.78 (1 H, m, PyH); m/z [MALDI] 1468, 1469, 1470, 1471, 1472 (MH⁺).

Example 11

Fac [2-(3'-Car G1-Ph)Py]₃Ir (5)

-22-

Fac tris[2-(3'-(3'',6''-di[4'''-(2'''-ethylhexyloxy)phenyl]carbazolyl)phenyl)pyridine]
iridium (III)

- A mixture of the 2-(3'-Car G1-Ph)Py **2** [Example 2] (3.25 g, 4.46 mmol), iridium chloride tri-hydrate (314 mg, 0.892 mmol), H₂O (7.0 cm³) and 2-ethoxyethanol (23 cm³) was heated (bath temperature: 127 °C) under argon for 40 h. The resultant orange mixture was allowed to cool to ambient temperature to precipitate the orange solid. The filtrate was separated and the 2-ethoxyethanol removed under high vacuum. The residue was purified by column chromatography over silica with DCM-light petroleum (1:30 to 0:1) as eluent to give 244 mg of the excess ligand **2** and 110 mg of the desired dichloro-bridged dimer **4**. The orange solid was purified by column chromatography over silica with DCM-light petroleum (0:1 to 1:0) as eluent to give 1.02 g of **4**. This was combined with the other fraction of **4** to give 1.13 g (75%); δ_{H} 0.86-1.01 (48 H, m, Me), 1.28-1.63 (64 H, m, CH₂), 1.71-1.87 (8 H, m, CH), 3.92 (16 H, m, ArOCH₂), 6.37 (4 H, m, ArH), 6.99-7.09 (24 H, m, ArH & PyH), 7.37 (8 H, m, CarH), 7.54 (8 H, m, CarH), 7.63 (16 H, m, ArH), 7.78-7.87 (8 H, m, PyH & CarH), 7.91 (4 H, m, PyH), 8.35 (8 H, m, CarH), and 9.48 (4 H, m, PyH); δ_{C} (101 MHz; CDCl₃) 11.2, 14.1, 23.1, 23.9, 29.1, 30.6, 39.4, 70.6, 110.0, 114.8, 118.2, 119.1, 122.4, 123.2, 123.7, 125.2, 128.2, 131.9, 132.1, 133.0, 134.3, 137.1, 140.7, 144.3, 145.4, 151.9, 158.4, and 167.8; m/z
- A mixture of the above obtained iridium complex **4** (910 mg, 0.540 mmol) and 2-(3'-Car G1-Ph)Py **2** (1.66 g, 2.28 mmol) and silver trifluoromethanesulfonate (277 mg, 1.08 mmol) was heated (bath temperature: 145 °C) for 6.5 days under argon. The reaction was then allowed to cool to room temperature. The dark brown mixture was purified by column chromatography over silica with DCM-light petroleum (0:1 to 1:4) as eluent to give 631 mg (49%) **5**; TGA_(5%) 420 °C; λ_{max} /nm (thin film) 265 and 297; δ_{H} (400 MHz; CD₂Cl₂) 0.92-1.04 (36 H, m, Me), 1.33-1.67 (48 H, m, CH₂), 1.78-1.87 (6 H, m, CH), 3.94 (12 H, m, ArOCH₂), 7.03 (4 H, m, ArH), 7.11 (1 H, m, PyH), 7.26 (1 H, m, ArH), 7.42 (1 H, m, ArH), 7.46-7.75 (9 H, m, CarH, ArH & PyH), 7.80 (1 H, m, PyH), 7.92 (1 H, m, PyH), 7.97 (1 H, m, ArH) and 8.41 (1 H, m, PyH); m/z [MALDI] 2374,

-23-

2375, 2376, 2377, 2378, 2379, 2380 (MH⁺). Moreover, 1.45 g of light yellow brown oil was isolated as the excess ligand 2.

Example 12

5 Fac [2-(3'-Car G2-Ph)Py]₃Ir (7)

Fac tris{2-[3'-(3",5"-di{3"',6"-di[4"',-(2"',-ethylhexyloxy)phenyl]carbazolyl}phenyl)phenyl]pyridine} iridium (III)

- A mixture of 2-(3'-Car G2-Ph)Py 3 (734 mg, 0.532 mmol), iridium chloride tri-hydrate (38 mg, 0.106 mmol), H₂O (1.5 cm³) and 2-butoxyethanol (6.5 cm³) was heated (bath temperature: 140 °C) under argon for 3 days before being cooled. The yellow precipitate was filtered off and washed with 95% of EtOH (~10 cm³). The yellow solid was dissolved into 5 cm³ of DCM and purified by column chromatography over silica using DCM-light petroleum (0:1 to 1:4) as eluent to give 85.2 mg (27 %) of a brown yellow solid as the dichloro-bridged dimer 6; *m/z* [MALDI] 2949 (broad) (C₁₉₄H₂₁₂IrN₆O₈-Cl⁺).
- 15 Moreover, a light yellow-brown solid was isolated (589 mg, 80%) as the excess ligand 3. A mixture of the above obtained iridium complex (80 mg, 0.27 mmol) and the recycled 2-(3'-Car G2-Ph)Py 3 (589 mg, 0.427 mmol) and silver trifluoromethanesulfonate (15 mg, 0.058 mmol) was heated (bath temperature: 160 °C) for 5.5 days under argon. The reaction was then allowed to cool to room temperature. The mixture was dissolved into
- 20 10 cm³ of DCM and purified by column chromatography over silica with DCM-light petroleum (0:1 to 1:0) as eluent to give 78 mg (67%) of solid as 7; λ_{max}/nm (thin film) 261 and 298; δ_H (500 MHz; CDCl₃) 0.89-1.00 (72 H, m, Me), 1.30-1.60 (96 H, m, CH₂), 1.72-1.84 (12 H, m, CH), 3.90 (24 H, m, ArOCH₂), 6.92-7.03 (30 H, m, ArH & PyH), 7.17 (3 H, m, PArH) 7.37 (3 H, m, PyH), 7.59-7.69 (51 H, m, ArH & CarH), 7.77 (3 H, m, ArH), 8.10-8.07 (12 H, m, ArH), and 8.34 (4 H, m, CarH); *m/z* [MALDI] 4327
- 25 (broad) (MH⁺). Excess ligand 3 was isolated as a light yellow-brown solid (380mg)

Example 13

2-(4'-Car G1-Ph)Py (21)

-24-

2-(4'-{3",6"-Di[4'''-(2'''-ethylhexyloxy)phenyl]carbazolyl}phenyl)pyridine

Tris(dibenzylideneacetone)di-palladium (0) [Pd₂(dba)₃] (114 mg, 0.124 mmol) and tri-
tert-butylphosphine (10% in hexane, 0.7 cm³) were added to a degassed (Schlenk line,
evacuated and back-filled with argon) mixture of DEHP-Car 1 [Example 1] (3.27 g, 5.68
5 mmol), 2-(4'-bromophenyl)pyridine 2(4'-BrPh)Py (2.66 g, 11.4 mmol) M. A. Gutierrez,
G. R. Newkome, J. Selbin, *J. Organomet. Chem.*, 1980, **202**, 341-350, sodium *tert*-
butoxide (1.64 g, 17.1 mmol), and distilled toluene (from sodium under nitrogen) (6.0
cm³). The dark purple mixture was degassed again before being heated at reflux (with
bath temperature of 90 °C for 48 h and then 140 °C for another 3 days under argon. The
10 mixture was allowed to cool and washed with H₂O (1 x 15 cm³), dried (MgSO₄), filtered
and the solvent removed. The mixture was purified by column chromatography over
silica using DCM-light petroleum (1:0 to 1:10) as eluent to give 2.87 g (69%) of 21 as
light brown yellow oil; *m/z* [APCI⁺] 729 (M⁺).

15 Example 14Br-btp (22)

A mixture of 2,5-di-bromopyridine (4.43 g, 18.7 mmol), thianaphthene-2-boronic acid
(4.00 g, 22.5 mmol), tetrakis(triphenylphosphine) palladium (0) (886 mg, 0.749 mmol),
20 2 M Na₂CO_{3(aq)} (18 cm³), EtOH (18 cm³) and toluene (50 cm³) was degassed and heated
at reflux (with bath temperature of 102 °C) under argon for 20 h. The mixture was
allowed to cool. The reaction precipitate mixture was filtered off and the precipitate
washed with light petroleum. The solid was dried under vacuum to give 4.53 g (83%) of
22.

25

Car G1-btp (23)

Tris(dibenzylideneacetone)di-palladium (0) [Pd₂(dba)₃] (50 mg, 0.055 mmol) and tri-
tert-butylphosphine (10% in hexane, 0.8 cm³) were added to a degassed (Schlenk line,

-25-

evacuated and back-filled with argon) mixture of DEHP-Car (**1**) (1.90 g, 3.30 mmol), Br-btp (**22**) (300 mg, 1.03 mmol), sodium *tert*-butoxide (348 mg, 3.62 mmol), and distilled toluene (from sodium under nitrogen) (2.0 cm³). The mixture was degassed again before being heated at reflux (with bath temperature of 112 °C) for 7.5 days under argon. The mixture was allowed to cool and 30 cm³ of DCM was added. H₂O (0.5 cm³) was added to the mixture. The mixture was then concentrated to about 10 cm³ and purified by column chromatography over silica using DCM-light petroleum (1:40 to 1:20) as eluent to give 156 mg (19%) of **23**; δ_{H} (200 MHz; CDCl₃) 0.83-1.08 (12 H, m, Me), 1.27-1.63 (16 H, m, CH₂), 1.70-1.89 (2 H, m, CH), 3.93 (4 H, m, ArOCH₂), 7.05 (4 H, m, ArH), 7.38-7.52 (4 H, m, ArH & CarH), 7.54-7.72 (6 H, m, ArH), 7.81-8.03 (5 H, m, CarH, ArH & PyH), 8.37 (2 H, m, CarH), and 8.94 (1 H, m, PyH; m/z (APCT⁺) 729 (M⁺).

Example 15

15 *Fac* [2-(4'-Car G1-Ph)Py]₃Ir (**25**)

Fac tris[2-(4'-{3'',5''-di[4'''-(2'''-ethylhexyloxy)phenyl]carbazolyl}phenyl)pyridine]iridium (III)

A mixture of 2-(4'-Car G1-Ph)Py **21** (2.57 g, 3.53 mmol), iridium chloride tri-hydrate (560 mg, 1.59 mmol), H₂O (5 cm³) and 2-butoxyethanol (30 cm³) was heated (bath temperature: 125-141 °C) under argon for 48 h. The resultant orange mixture was allowed to cool to ambient temperature to precipitate the orange solid. The solid was filtered and washed with 95% of EtOH. Further purification of the residue by column chromatography over silica with DCM-light petroleum (0:1 to 1:0) as eluent gave the dichloro-bridged dimer **24**; δ_{H} (400 MHz; CDCl₃) 0.93-1.01 (48 H, m, Me), 1.32-1.64 (64 H, m, CH₂), 1.73-1.88 (8 H, m, CH), 3.93 (16 H, m, ArOCH₂), 6.28 (4 H, m, ArH), 7.75 (4 H, m, PyH), 7.01 (16 H, m, ArH), 7.12 (4 H, m, ArH), 7.33 (8 H, m, CarH), 7.51 (8 H, m, CarH), 7.58-7.70 (20 H, m, ArH), 7.74 (4 H, m, PyH), 7.90 (4 H, m, PyH), 8.25 (8 H, m, CarH), and 9.49 (4 H, m, PyH); δ_{C} (101 MHz; CDCl₃) 11.2, 14.1, 23.1, 23.9, 29.1,

-26-

30.6, 39.4, 70.6, 110.7, 114.8, 117.9, 119.1, 119.2, 124.0, 125.0, 127.7, 128.1, 133.1, 134.3, 137.0, 137.8, 139.6, 142.6, 146.3, 151.3, 158.5, and 167.5;

Using a method similar to that described in Example 11, the dichloro-bridged dimer 24 can then be used to form the dendrimer 25.

-27-

Example 16

Compound	Device structure	Peak efficiency (PE) (cd/A) ($\pm 10\%$)	Voltage at PE	Brightness at PE (cd/m ²)	Max brightness and voltage cd/m ² at V	Turn on voltage (V)
5	ITO/5 (45 nm)/Ca (20 nm)/Al (100 nm)	9.8	6.8	472	6130 at 11.8	3.6
G1-IrppyCarb						
5	ITO/5 (45 nm)/TPBI (45 nm)/LiF (0.6 nm)/Ca (20 nm)/Al (100 nm)	12.9	4.8	156	11730 at 13.8	3
G1-IrppyCarb						
7	ITO/7 (45 nm)/Ca (20 nm)/Al (100 nm)	22	13	10910	11990 at 13.4	5.4
G2-IrppyCarb						
7	ITO/7 (45 nm)/TPBI (45 nm)/LiF (0.6 nm)/Ca (20 nm)/Al (100 nm)	13	10	99	3700 at 20	6.4
G2-IrppyCarb						
Comparative Ir-G2	ITO / G2-Ir (120 nm) / Ca (20 nm) / Al (100nm)	7	12	1250	>6000 @ 17	4.2

The device was prepared as follows:

1. Etch ITO squares 12x12 mm into 4x12 mm ITO strip by acid etch
2. Acetone rinse for 10 minutes with ultrasonication
3. Propan-2-ol rinse for 10 minutes with ultrasonication
4. Substrates dried under dry nitrogen flow
5. Substrates subject to oxygen plasma treatment for 5 minutes at 100 W
6. Dendrimer film deposited by spin coating
7. Substrates placed in vacuum evaporator
8. 20 nm of calcium deposited at 0.1 nm/s under vacuum of 1×10^{-6} mBar
9. 100 nm of aluminium deposited at 0.1 nm/s under vacuum of 1×10^{-6} mBar

The table shows the performance of devices made with two types of dendrimer according to the current invention (compounds 5 and 7) and a comparative example for a device made with an Ir-cored dendrimer (Ir-G1) that does not have N atoms as part of units in the dendrons.

-28-

Ir-G2 is *fac* tris{2-[3'-(3'',5''-di{3''',5'''-di[4''''-2''''-ethylhexyloxy)phenyl]phenyl}phenyl}

Phenyl]pyridine}iridium (III) which is a second generation dendrimer. Ir-G1 is *fac* tris

[2-(3'-(3'',5''-di[4''-(2''''-ethylhexyloxy)phenyl]phenyl}phenyl)pyridine]iridium (III)

which is a first generation dendrimer. (The synthesis of these dendrimers is given in the PCT application claiming priority from GB 0104175.5).

As can be seen from the table the efficiency of a device containing a neat layer of the second generation dendrimer 7 is greater than that of a device containing a neat layer of the first generation dendrimer 5. Both of the devices based on the new dendrimers show better efficiency than the comparative example. Although not shown a device with a neat layer of Ir-G1 has a lower efficiency than a device with a neat layer of Ir-G2. These results clearly show that Ir dendrimers that have dendrons containing carbazole units offer marked benefits over the previously known Ir dendrimers.

Photoluminescent quantum yield (PLQY) of Green Ir-Dendrimers in Neat Films

Dendrimer	PLQY %
Ir-G1	22
Ir-G2	31
Ir-Carb G1 5	48
Ir-Carb G2 7	35

These film PLQYs were measured in an integrating sphere following excitation at 325nm. The PLQYs are higher for both the carbazole-type dendrimer films than the non-carbazole-type iridium dendrimer films, with the most marked increase (22% to 48%) shown by the first generation dendrimers.

Compound 5 undergoes a number of chemically reversible electrochemically quasi-reversible oxidations in dry inert conditions, whereas under the same conditions both *fac* tris(2-phenylpyridine) iridium (III) and the dendrimer Ir-G1 each only undergo one chemically reversible electrochemically quasi-reversible oxidation. However the

-29-

reduction behaviour of 5 is very similar to the behaviour of the non-carbazole-type first generation iridium dendrimer Ir-G1.

Example 17

G1-Ir-Carbazole (5) of Example 11 and G2-Ir-Carbazole (7) of Example 12 were used in single-layer OLED devices. They were obtained from a 15mg/ml solution in chloroform and spin coated at 2000rpm for 60 seconds to provide the structure ITO/Dendrimer/Ca/Al. The thickness of the layer of compound 5 was about 45 nm and that of compound 7 about 65nm. The CIE coordinates obtained are $x = 0.340$, $y = 0.610$ for G1-Ir-carbazole (5) and $x = 0.332$, $y = 0.628$ for G2-Ir-Carbazole (7).

-30-

CLAIMS

1. A light emitting device which comprises at least one layer that contains a phosphorescent organometallic dendrimer with a metal cation as part of its core and with
5 at least one dendron which comprises at least one nitrogen atom which forms part of an aromatic ring system or is directly bonded to at least two aromatic groups.
2. A device according to claim 1 wherein the dendrimer is in the light emitting layer.
3. A device according to claim 1 or 2 wherein the dendrimer is the light
10 emitting material.
4. A device according to any one of claims 1 to 3 wherein the dendrimer is phosphorescent in the solid state.
5. A device according to any one of the preceding claims wherein the dendrimer has at least one inherently at least partly conjugated dendron.
- 15 6. A device according to claim 5 wherein the dendrimer has at least 2 inherently at least partly conjugated dendrons.
7. A device according to claim 6 wherein all the dendrons are inherently at least partly conjugated.
8. A device according to any one of the preceding claims wherein the
20 dendrimer is used as a homogeneous layer.
9. A device according to any one of claims 1 to 7 wherein the dendrimer is blended with one or more other dendrimers and/or polymers and/or molecular materials.
10. A device according to claim 9 wherein the molar ratio of organometallic dendrimer to other component(s) is from 1.0001:1 to 100:0.001.
- 25 11. A device according to claim 9 wherein the molar ratio of organometallic dendrimer to other component(s) is from 1:1 to 1:100.

-31-

12. A device according to any one of the preceding claims wherein at least one dendron comprises at least one nitrogen atom which forms part of a carbazole ring.

13. A device according to any one of the preceding claims wherein all the nitrogen atoms in the dendron are part of carbazole groups.

5 14. A device according to any one of the preceding claims wherein the dendrimer comprises 3 to 21 carbazole units.

15. A device according to any one of claims 1 to 11 wherein at least one dendron comprises at least one nitrogen atom which is directly bonded to 2 to 3 aryl or heteroaryl groups.

10 16. A device according to any one of the preceding claims wherein the dendrimer comprises at least one nitrogen atom as defined in claim 12 and at least one nitrogen atom as defined in claim 15.

17. A device according to any one of the preceding claims wherein the organometallic dendrimer has the formula (I):-

15

in which CORE represents a metal cation or a group containing a metal cation, n represents an integer of 1 or more, each DENDRON, which may be the same or different, represents a dendritic molecular structure comprising at least one nitrogen atom which forms part of an aromatic ring system or is directly attached to at least two aromatic groups, CORE terminating in the single bond to the first nitrogen atom or aromatic ring to which more than one dendritic chain is attached, said nitrogen atom or ring forming part of said DENDRON.

25 18. A device according to claim 17 wherein CORE terminates in a single bond to a first nitrogen atom which forms part of an aromatic ring system to which more than one dendritic chain is attached.

-32-

19. A device according to claim 18 wherein CORE terminates in a single bond to a first nitrogen atom to which two dendritic chains are attached.

20. A device according to any one of claims 17 to 19 wherein at least one said DENDRON comprises an aromatic group in conjugation with a said nitrogen atom
5 or a nitrogen-containing aromatic ring system.

21. A device according to any one of claims 17 to 20 wherein the said single bond is attached to a carbazole group to which more than one dendritic chain is attached.

22. A device according to any one of claims 17 to 20 wherein the said
10 single bond is attached to an aryl group to which one or more carbazole groups are attached.

23. A device according to any one of claims 17 to 22 wherein the aromatic group is a phenyl group or a heteroaryl group.

24. A device according to any one of claims 1 to 16 wherein the
15 organometallic dendrimer has the formula (I):-

in which CORE represents a metal cation or a group containing a metal cation, n
20 represents an integer of 1 or more, each DENDRON, which may be the same or different, represents a dendritic molecular structure comprising at least one nitrogen atom which forms part of an aromatic ring system or is directly attached to at least two aromatic groups, CORE terminating in the single bond to the first Sp^3 hybridised carbon atom to which more than one dendritic chain is attached.

25 25. A device according to any one of the preceding claims wherein the links between branching groups in the dendron are phenyl or fluorenyl groups.

-33-

26. A device according to any one of the preceding claims wherein the organometallic dendrimer comprises at least one co-ordinating group which is not dendritic.

27. A device according to any one of the preceding claims wherein the
5 CORE is represented by formula (II):-

where M is a metal ion, each [X-], which are the same or different, is a coordinating
10 group X attached to a single bond in which CORE terminates, each Y, which may be the same or different, is a coordinating group, q is an integer and r is 0 or an integer, the sum of (a.q) + (b.r) being equal to the number of coordination sites available on M, wherein a is the number of coordination sites on [X-] and b is the number of coordination sites on Y.

15 28. A device according to any one of the preceding claims wherein the metal cation is a second or third row transition metal.

29. A device according to any one of the preceding claims wherein the metal cation is iridium.

30. A device according to claim 29 wherein the core comprises an iridium
20 cation and an aryl-pyridine or a hetero aryl-pyridine.

31. A device according to claim 30 wherein the core comprises an iridium cation and a phenylpyridine.

32. A device according to any one of claims 1 to 28 wherein the metal cation is rhenium.

25 33. A device according to any one of the preceding claims, wherein at least one surface group is attached to the distal end of the dendrites.

-34-

34. A device according to claim 33 wherein the surface group is such as to allow solution processing.

35. A device according to claim 33, wherein at least one surface group is selected from a further-reactable alkene, (meth)acrylate, sulphur-containing, or silicon-
5 containing group; sulphonyl group; polyether group; C₁-to-C₁₅ alkyl group; amine group; mono-, di- or tri- C₁-to-C₁₅ alkyl amine group; -COOR group wherein R is hydrogen or C₁-to-C₁₅ alkyl; -OR group wherein R is hydrogen, aryl, or C₁-to-C₁₅ alkyl or alkenyl; -O₂SR group wherein R is C₁-to-C₁₅ alkyl or alkenyl; -SR group wherein R is aryl, or C₁-to-C₁₅ alkyl or alkenyl; -SiR₃ group wherein the R groups are the same or different and
10 are hydrogen, C₁-to-C₁₅ alkyl or alkenyl, or -SR' group (R' is aryl or C₁-to-C₁₅ alkyl or alkenyl), aryl, or heteroaryl.

36. A device according to claim 35 wherein the surface group is such as to allow patterning.

37. A device according to claim 35 or 36 wherein the layer containing the
15 organometallic dendrimer has been deposited by solution processing.

38. A device according to any one of claims 2 to 37 which comprises in addition to the light emitting layer at least one charge transporting and/or injecting layer.

39. A device according to any one of the preceding claims which is a light-
20 emitting diode (LED).

40. A device according to any one of claims 1 to 38 which is a photovoltaic device.

41. A device according to claim 1 substantially as hereinbefore described.

42. A phosphorescent organometallic dendrimer with a metal cation as part of
25 its core with at least one dendron which comprises at least one nitrogen atom which forms part of an aromatic ring system or is directly bonded to at least two aromatic groups.

-35-

43. An organometallic dendrimer according to claim 42 wherein the nitrogen atom forms part of a carbazole ring.

44. An organometallic dendrimer according to claim 42 or 43 wherein the nitrogen atom is directly attached to 2 or 3 aryl groups.

5 45. An organometallic dendrimer according to any one of claims 42 to 44 wherein the dendrimer comprises at least one nitrogen atom as defined in claim 43 and at least one nitrogen atom as defined in claim 44.

46. An organometallic dendrimer according to any one of claims 42 to 45 which is phosphorescent in the solid state.

10 47. An organometallic dendrimer according to claim 42 which has one or more of the features of claims 5 to 7 and 12 to 36.

48. A process for producing a dendrimer as claimed in any one of claims 42 to 47, which process comprises:

15 (a) providing a core by forming a complex between a metal cation and one or more coordinating groups, at least two of the said groups bearing a reactive functionality; and

(b) treating the core thus provided with one or more dendrons which have been functionalised to render them reactive towards the reactive functionalities present in the core, at least one of the dendrons comprising
20 at least one nitrogen atom which forms part of an aromatic ring system or is directly bonded to at least two aromatic groups.

49. A process according to claim 48 wherein at least one of the coordinating groups does not contain a reactive functionality and consequently remains free of attachment to a dendron in step (b).

25 50. A process according to claim 48 or 49 wherein the core provided in step (a) is represented by formula (II) as defined in claim 27 wherein each [X-] includes a reactive functionality.

-36-

51. A process for producing a dendrimer as claimed in any one of claims 42 to 47, which process comprises:

- 5 (a) attaching a coordinating group to each of one or more dendrons, at least one of which comprises at least one nitrogen atom which forms part of an aromatic ring system or is directly bonded to at least two aromatic groups and
- (b) forming a complex between the coordinating groups and a metal cation which is optionally bonded to one or more ligands which remain in the resulting complex.

10 52. A process for producing a dendrimer as claimed in any one of claims 42 to 47, which process comprises:

- 15 (a) attaching a coordinating group to each of one or more dendrons at least one of which comprises at least one nitrogen atom which forms part of an aromatic ring system or is directly bonded to at least two aromatic groups;
- (b) forming a complex between the coordinating groups and a metal cation; and
- (c) optionally further treating said complex with one or more additional coordinating ligands.

20 53. A process according to claim 51 or 52 wherein the complex formed between coordinating groups and the metal cation in step (b) is represented by formula (II) as defined in claim 27.

-37-

ABSTRACTPHOSPHORESCENT DENDRIMERS

5

A light emitting device which comprises at least one layer that contains a phosphorescent organometallic dendrimer with a metal cation at its core and with at least one dendron which comprises at least one nitrogen atom which forms part of an aromatic ring system or is directly attached to at least two aromatic groups.
